LABOUR FORCE SURVEY ROUND 9: MARCH 2004

This statistical release presents a selection of key findings and tables from Stats SA's ninth labour force survey (LFS), conducted in March 2004. The LFS examines various aspects of the labour market including the pattern of employment in both the formal and informal sectors of the economy, and the extent of unemployment. The survey gathered detailed information on approximately 68 000 adults of working age (15–65 years) living in 30 000 dwelling units across the country. This release also compares the employment and unemployment situation in March 2004 with data from the previous LFS of September 2003.

INTRODUCTION

The LFS is a twice-yearly rotating panel household survey, specifically designed to measure the dynamics of employment and unemployment in the country. It also provides insight into a variety of issues related to the labour market, including unemployment rates (official and expanded), according to standard definitions of the International Labour Organisation (ILO). *For these definitions see Note 1 below.*

At present Statistics South Africa uses a rotating panel methodology to collect labour force statistics from households, to ultimately obtain a better picture of movements into and out of the labour market over time. A rotating panel sample involves visiting the same dwelling units on a number of occasions (in this instance, five at most). After the panel is established, a proportion of these dwelling units is replaced each round (in this instance, 20%). New dwelling units are added to the sample to replace those that are taken out. The advantage of this type of design is that it provides the basis for monitoring changes in the work situation of members of the same households over time, while retaining the larger picture of the overall employment situation in the country. It also allows for both longitudinal and cross-sectional analysis.

The first pilot round of LFS fieldwork took place in February 2000, based on a probability sample of 10 000 dwelling units. The sample was increased to 30 000 dwelling units in September 2000. The results of both these surveys, benchmarked to Census 1996, were published as discussion documents. The third round of the LFS took place in February 2001, using the same 30 000 dwelling units as in the second round. The results of this third round were again benchmarked to Census 1996 but published as official statistics. Since then all rounds have been published as official statistics.

For the fourth round, conducted in September 2001, a new sample of 30 000 dwelling units was visited, because of complaints about response fatigue following the LFS and the Income and expenditure survey undertaken at the same time in the same household. The benchmark used for both surveys was also Census '96. Rotation of 20% of the new sample was implemented during the fifth round in February 2002. Of the 30 000 dwelling units visited during the fourth LFS, 80% were visited again. The remaining 20% comprised new dwelling units. The same rotation procedure has been implemented for all subsequent rounds. In this statistical release, key findings of the ninth round is presented, and in some instances, comparison is made with the results from the eighth round.

At this stage, all the labour force survey results are based on a cross-sectional analysis, since the matching process is still underway. Longitudinal analysis will be undertaken at a later stage.

THE LABOUR MARKET IN MARCH 2004

Stats SA uses two measures of unemployment, the official and the expanded definitions¹. One of the conditions for a person to be classified as unemployed is that s/he should be available to take up employment during the reference period. Up until now, Statistics South Africa has been using a period of one week for this criterion. However, not everyone who is seeking work can be expected to take up a job immediately when it is offered. A person could be temporarily sick, or may have to make arrangements concerning childcare. **Statistics South Africa has therefore decided to increase the availability period from one week to two weeks for both the official and expanded definitions of unemployment.** The ILO guidelines allow for a reference period of one or two weeks in this regard.

Table A shows the overall labour market patterns for March 2004, based on the official definition of unemployment, using both the new and the old definitions. The table shows that the working-age population (i.e. all persons aged 15–65 years) can be grouped as follows:

- (a) the number of persons who are employed,
- (b) the number of persons who are unemployed,
- (c) those who are economically active (i.e. both the employed and the unemployed),
- (d) the number of persons who are not economically active (for example, full-time students, full-time homemakers, retired people and the disabled who are unable to work),
- (e) the total number aged 15–65,
- (f) the unemployment rate (i.e. the percentage of economically active persons who are unemployed),
- (g) the labour force participation rate (i.e. the percentage of all people aged 15–65 years who were economically active), and
- (h) the labour absorption rate (i.e. the percentage of all those aged 15–65 years who were actually employed) in March 2004.

Table A (based on the official definition) compares key labour market outcomes using the two reference periods. In March 2004, there were an estimated 30,4 million people aged 15–65 years. Among them:

- 12,0 million were employed; and
- 4,6 million were unemployed, using the new reference period criterion of ‘available to start work within two weeks’; or alternatively,
- 4,5 million were unemployed, using the old reference period of ‘available to start work within one week’

Table A: Labour market pattern in March 2004 based on the official definition of unemployment

Labour market category	Start work within	
	one week N ('000)	two weeks N ('000)
a Total employed	11 984	11 984
b Total unemployed (official definition)	4 532	4 611
c Total economically active = a + b	16 516	16 596
d Total not economically active	13 913	13 833
e Total aged 15–65 years = c + d	30 429	30 429
f Unemployment rate = b * 100 / c	27,4%	27,8%
g Labour force participation rate = c * 100 / e	54,3%	54,5%
h Labour absorption rate = a * 100 / e	39,4%	39,4%

Table A shows that the difference in the unemployment numbers according to the two availability reference periods are small – 4 532 000 people using the one week criterion compared with 4 611 000 people using the two-week criterion. The resulting unemployment rates are therefore virtually unchanged – 27,4% (on the basis of the one-week reference period) compared with 27,8% (on the basis of the two-week reference period). The new official unemployment rate is 27,8%.

¹ See definition of terms

LABOUR MARKET CHANGES

Labour market trends: September 2003 and March 2004

Table B indicates that there have been no significant changes in the labour market between September 2003 and March 2004. We are 95% confident that some of the differences in the estimates for these two periods can be attributed to sampling error.

**Table B: LFS labour market measurements based on the official definition:
September 2003 and March 2004 (within 95% confidence limits)**

Variable			Lower limit ('000)	Esti-mate ('000)	Upper limit ('000)	Precision of difference	Actual difference
a	Total employed					445	332
		Sep 2003	11 422	11 652	11 882		
b	Total unemployed (official definition)	Mar 2004	11 604	11 984	12 365	298	-16
		Sep 2003	4 424	4 627	4 830		
c	Total economically active	Mar 2004	4 393	4 611	4 830	563	317
		Sep 2003	15 963	16 279	16 595		
d	Total not economically active	Mar 2004	16 129	16 596	17 062	549	195
		Sep 2003	13 290	13 638	13 985		
e	Total aged 15-65 years = c + d = e	Mar 2004	13 409	13 833	14 258	890	512
		Sep 2003	29 406	29 917	30 428		
f	Official unemployment rate b/c*100 = f	Mar 2004	29 701	30 429	31 158	1,4	-0,6
		Sep 2003	27,5%	28,4%	29,4%		
g	Labour force participation rate = c/e*100 = g	Mar 2004	26,7%	27,8%	28,8%	1,1	0,1
		Sep 2003	53,7%	54,4%	55,1%		
h	Labour absorption rate = a/e*100 = h	Mar 2004	53,7%	54,5%	55,4%	1,2	0,5
		Sep 2003	38,2%	38,9%	39,7%		
		Mar 2004	38,5%	39,4%	40,3%		

* Statistically significant at 95% level of confidence

For example, the total number of employed people was estimated at 11 652 000 in September 2003; by March 2004, this number had risen to 11 984 000. The difference between the two figures is 332 000. However 332 000 lies between -445 000 and +445 000 (precision of difference). This implies that the difference between the two estimates is not statistically significant. Therefore the increase in the number of employed people between September 2003 and March 2004 is not statistically significant and can be explained by sampling error.

- Taking sampling error into account, the increase in the total number of people who were economically active between September 2003 and March 2004 is not statistically significant.
- The decrease in the number of unemployed people between September 2003 and March 2004 using the official definition of unemployment is also not statistically significant.
- The decrease in the unemployment rate from 28,4% in September 2003 to 27,8% in March 2004 is not statistically significant.
- The labour force participation rate also did not show any significant change between September 2003 (54,4%) and March 2004 (54,5%).
- The labour absorption rate increased but this was not statistically significant.

**Table C: Employment distribution by industry: September 2003 and March 2004
(within 95% confidence limits)**

Industry		Lower limit ('000)	Estimate ('000)	Upper limit ('000)	Precision of difference	Actual difference

Transport					70	35
	Sep 2003	519	564	610		
	Mar 2004	545	599	652		
Business services					115	23
	Sep 2003	1 008	1 081	1 154		
	Mar 2004	1 015	1 104	1 193		
Community services					164	14
	Sep 2003	2 163	2 269	2 374		
	Mar 2004	2 157	2 283	2 408		
Private households					113	7
	Sep 2003	1 118	1 188	1 257		
	Mar 2004	1 105	1 195	1 284		
Other/unspecified industry						
	Sep 2003		34			
	Mar 2004		29			

Table C compares the distribution of employed persons by industry in September 2003 with March 2004. Although all industries indicate increases in the number of workers over the period September 2003 to March 2004, none of these increases is statistically significant.

EMPLOYMENT IN THE FORMAL AND INFORMAL SECTORS

Employment by sector: September 2003 and March 2004

Comparing employment status by sector between September 2003 and March 2004, Table D indicates the following:

- The increase in the total number of employed people from approximately 11,7 million in September 2003, to approximately 12,0 million in March 2004 is not statistically significant.
- The increase from approximately 7,5 million to 7,8 million in the total number of people employed in the formal sector, excluding agriculture, over this period, was also not statistically significant.
- There was a slight increase in employment in commercial agriculture but the increase is also not statistically significant.
- Employment in subsistence or small-scale farming remained stable.
- Employment in the informal sector remained stable.
- Employment in domestic service also remained stable.

**Table D: Employment by sector: September 2003 and March 2004
(within 95% confidence limits)**

		Lower limit ('000)	Estimate ('000)	Upper limit ('000)	Precision of difference	Actual difference
Total employed					445	332

	Mar 2004	940	1 013	1 086		
Employed sector unspecified	Sep 2003		17			
	Mar 2004		44			

* Statistically significant at 95% level of confidence

Employment by sector and gender

Figure 1 illustrates the pattern of employment in each sector by gender in March 2004. The formal sector includes commercial agriculture, and the informal sector includes small-scale or subsistence agriculture but excludes domestic workers, who are grouped separately. The figure shows that in March 2004:

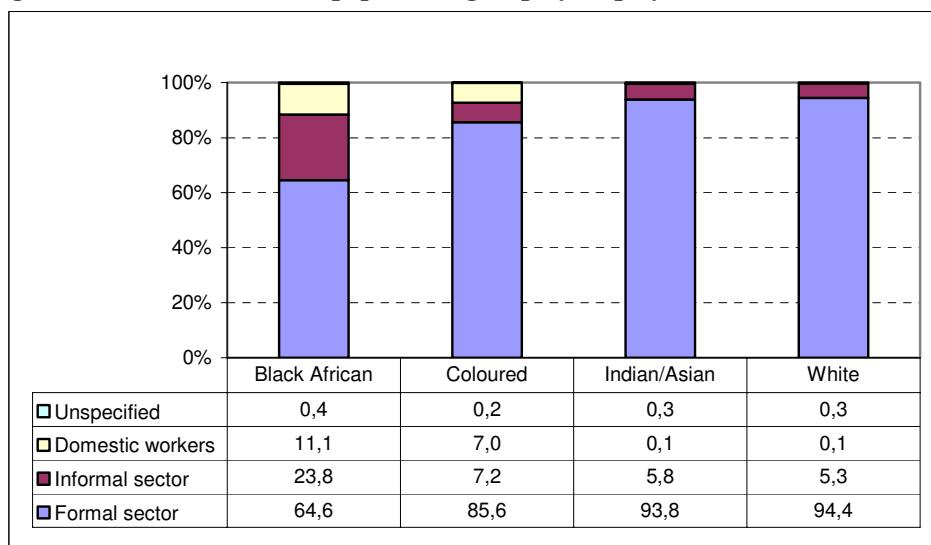

- The formal sector accounted for the largest share of total employment among both men (80,4%) and women (63,7%).
- Among employed men the informal sector accounted for 18,6% of jobs, similar to the percentage among women (17,5%).
- Overall, 8,5% of the employed population were domestic workers. However, the share of domestic workers among employed women was much bigger (18,6%) than among employed men (0,6%).

Figure 1: Male and female workers by employment sector: March 2004

Employment by sector and population group

Figure 2 indicates that in March 2004:

- Across all population groups the majority of workers were employed in the formal sector and a relatively small proportion was employed as domestic workers. The percentage of persons employed in the formal sector was lowest among African (64,6%) and coloured (85,6%) workers and highest among Indian/Asian (93,8) and white (94,4%) workers.
- As a result, informal sector employment was highest among the African population group (23,8%) and lowest among the Indian/Asian (5,8%) and white (5,3%) population groups.
- The percentage of African workers employed as domestic workers was 11,1%, and of coloured workers 7,0%, compared to only 0,1% of the Indian/Asian and white population groups.

Figure 2: Workers in each population group by employment sector: March 2004

Employment by main industry and sector

Table E compares employment in the formal and informal sectors by industry. It indicates that in March 2004:

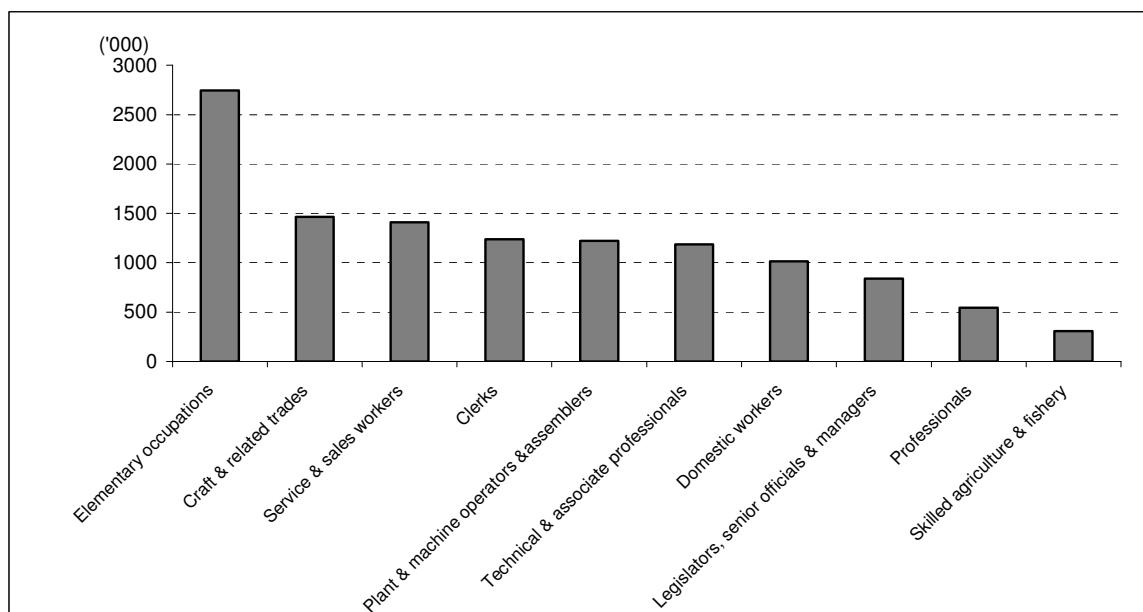

- Overall 8,8 million people were employed in the formal sector, about 2,2 million people in the informal sector, and 1,0 million in domestic work.
- The largest group of people employed in the formal sector worked in the community, social and personal services industry (24,1%), whereas in the informal sector the largest group worked in trade (39,6%).
- Approximately 15,5% of the people working in the informal sector were employed in agriculture, making the agricultural industry the second largest industry in terms of informal sector employment.
- In contrast, only 10,6% of those working in the formal sector were employed in agriculture, making this industry the fifth largest in terms of formal sector employment.

Table E: Employment in the formal and informal sectors by industry (including agriculture), March 2004

Industry	Formal		Informal		Domestic		Total	
	N ('000)	%	N ('000)	%	N ('000)	%	N ('000)	%
Agriculture	930	10,6	337	15,5			1 271	10,6

Employment by main occupation

Figure 3 indicates that most of the employed were working in elementary occupations excluding domestic work (about 2,7 million people), followed by craft and related trades workers (about 1,5 million people) and then service workers (about 1,4 million people). The occupational group with the least number of workers was skilled agricultural and fishery workers (approximately 0,3 million people). Skilled agricultural workers include skilled field crop and vegetable growers; gardeners, horticultural and nursery growers; dairy and livestock producers; poultry producers; and forestry workers and loggers; while unskilled farm labourers fall in the elementary occupations group.

Figure 3: Workers by main occupation: March 2004

Comparison of formal employment figures in the LFS and the SEE

Formal sector employment figures may also be obtained from another Stats SA data set, namely the quarterly survey of employment and earnings (SEE), which specifically collects information on formal employment in South Africa (excluding non-VAT-registered businesses as described below). The SEE of March 2004 is comparable to the LFS of March 2004.

One important difference between the two surveys is that SEE obtains data from businesses, while the LFS is a household-based survey. Households contain people working in all industries whether or not the owners of those businesses pay VAT.

The SEE, on the other hand, collected information in March 2004 from formal sector businesses registered for VAT, where the annual turnover is R300 000 or more. (Only businesses that make R300 000 turnover per annum or more are compelled to register for VAT. A business that does not meet this threshold is not included in the sample for SEE, even if it is VAT-registered.) The SEE therefore misses certain formal and informal sector businesses that are covered by the LFS. In addition, the SEE excludes agriculture, forestry, hunting and fishing.

Table F indicates that in March 2004, according to the SEE, approximately 6,4 million people were employed in the formal sector excluding commercial agriculture. An additional 2,3 million people working in the formal sector were covered by the LFS but not by the SEE.

Table F: Formal sector employment based on the LFS and the SEE of March 2004

	N ('000)
Employed according to SEE	6 448
Employed in formal sector in activities not covered in SEE	2 309
Total	8 757

Comparison of formal sector employment by industry in the LFS and the SEE of March 2004

Table G indicates that, except for business services, lower levels of employment are recorded in the SEE than the LFS in all types of industry covered by both surveys. Moreover all the differences are statistically significant except for the mining industry. These differences are most probably explained by the fact that the SEE focuses on VAT-registered businesses with a minimum turnover of R300 000.

Table G: Comparison by industry of formal sector employment as measured in the LFS and the SEE of March 2004

UNEMPLOYMENT IN MARCH 2004

Unemployment rate by province (official definition)

Figure 4 compares the provincial unemployment rate in September 2003 with March 2004. All provinces showed a relatively stable unemployment rate between September 2003 and March 2004 except Free State, Northern Cape and Western Cape. These provinces showed a downward trend. The decrease in unemployment rate from 27,6% in September 2003 to 22,3% in Northern Cape is notable and may partly be attributed to the relatively small sample size in that province. Over the same period there was also a marked decline in the unemployment rate in Western Cape, from 20,7% to 16,9%. In March 2004, the unemployment rate was highest in Eastern Cape (32,5%) and lowest in Western Cape (16,9%). As shown in Figure 4, this pattern was also reflected in the September 2003 results.

**Figure 4: Unemployment rate (official definition) by province:
September 2003 and March 2004**

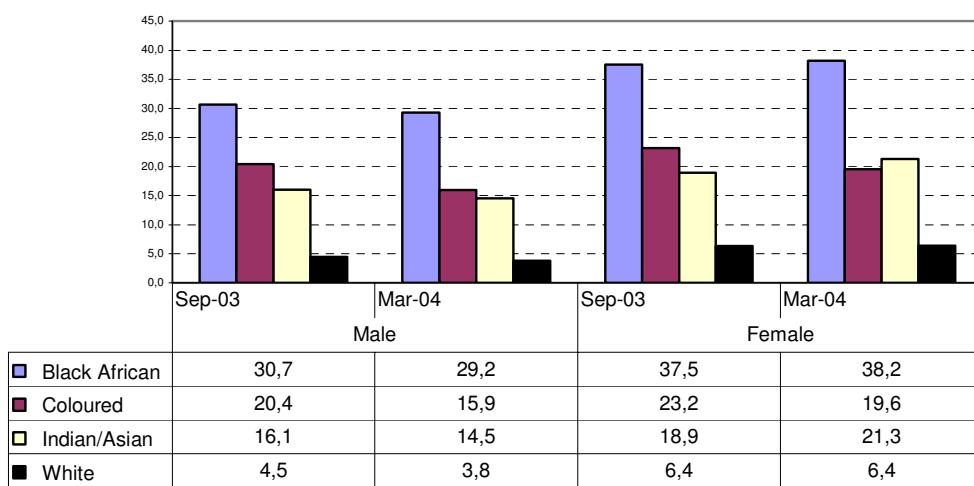

Unemployment rate by population group and gender (official definition)

Figure 6 indicates that:

- Both in September 2003 and March 2004, the unemployment rate among Africans was the highest among the population groups, while whites had the lowest unemployment rate.
- The unemployment rate for women exceeded that of men in all population groups.

**Figure 5: Unemployment rate (official definition) by population group and sex:
September 2003 and March 2004**

LABOUR MARKET TRENDS: EXPANDED DEFINITION OF UNEMPLOYMENT

The main difference between the official and the expanded definitions of unemployment is the requirement in the former that, in order to be classified as unemployed, a person must have engaged in job seeking in the four weeks prior to the interview (*see Note 1 for both definitions*).

The main difference between the official and the expanded definitions of unemployment is the requirement in the former that, in order to be classified as unemployed, a person must have engaged in job seeking activities in the four weeks prior to the interview (*see Note 1 for both definitions*).

Table H, Stats SA shows the overall labour market patterns for March 2004, based on the expanded definition of unemployment, for both the new and the old definitions.

As in the case of the official definition, the change in the reference period from one week to two weeks in terms of the ‘availability to start work’ criterion, makes little difference to key labour market outcomes. Using the one week cut-off, the number of unemployed persons based on the expanded definition is 8 267 000 while using the two-week cut-off the number is 8 412 000. The resulting expanded unemployment rates are therefore 40,8% (based on the one week criterion) and 41,2% (based on the two weeks criterion). Henceforth, the expanded unemployment rate will be based on the latter (41,2%).

Table H: Labour market patterns in March 2004 based on the expanded definition of unemployment

Labour market category	Start work within	
	one week	two weeks
	N ('000)	N ('000)
a Total employed	11 984	11 984
b Total unemployed (expanded definition)	8 267	8 412
c Total economically active = a + b	20 252	20 396
d Total not economically active	10 177	10 033
e Total aged 15–65 years = c + d	30 429	30 429
f Unemployment rate = b * 100 / c	40,8%	41,2%
g Labour force participation rate = c * 100 / e	66,6%	67,0%
h Labour absorption rate = a * 100 / e	39,4%	39,4%

Table I below gives a comparison of the labour market between September 2003 and March 2004, using the expanded definition of unemployment.

**Table I: LFS labour market measurements based on the expanded definition:
September 2003 and March 2004 (within 95% confidence limits)**

			Lower limit (000s)	Esti- mate (000s)	Upper limit (000s)	Precision of difference	Actual difference
a	Total employed	Sep 2003	11 422	11 652	11 882	445	332
		Mar 2004	11 604	11 984	12 365		
b	Total unemployed (expanded definition)	Sep 2003	8 171	8 446	8 721	417	-34
		Mar 2004	8 098	8 412	8 725		
c	Total economically active	Sep 2003	19 738	20 098	20 459	636	298
		Mar 2004	19 872	20 396	20 921		
d	Total not economically active	Sep 2003	9 566	9 818	10 071	396	215
		Mar 2004	9 727	10 033	10 338		
e	Total aged 15–65 years = c + d = e	Sep 2003	29 406	29 917	30 428	890	512
		Mar 2004	29 701	30 429	31 158

		Mar 2004	40,1%	41,2%	42,3%		
g	Labour force participation rate = c/e*100 = g	Sep 2003	66,6%	67,2%	67,7%	0,9	-0,2
		Mar 2004	66,4%	67,0%	67,7%		
h	Labour absorption rate = a/e*100 = h	Sep 2003	38,2%	38,9%	39,7%	1,2	0,5
		Mar 2004	38,5%	39,4%	40,3%		

* Statistically significant at 95% level of significance

Table I shows that, according to the expanded definition of unemployment, there was no statistically significant change in unemployment between September 2003 and March 2004. The number of unemployed people remained stable between September 2003 and March 2004.

Mr Pali Lehohla
Statistician-General: Statistics South Africa

TECHNICAL NOTES

1. Official and expanded unemployment rates

Statistics South Africa (Stats SA) uses the following definition of unemployment as its *official* definition. The *unemployed* are those people within the *economically active population* who: (a) did not work during the seven days prior to the interview, (b) want to work and are available to start work within two weeks² of the interview, and (c) have taken active steps to look for work or to start some form of self-employment in the four weeks prior to the interview. The *expanded definition of unemployment* excludes criterion (c).

Among those who are included in the expanded but not the official definition of unemployment will be discouraged job seekers (those who said they were unemployed but had not taken active steps to find work in the four weeks prior to the interview).

Stats SA reports on the situation of the unemployed using both the official and the expanded definitions. In the present economic climate, there is a proportion of discouraged work seekers who face constraints, for example high travel costs and lack of transport, when seeking work.

2. Sample design

A multi-stage stratified sample was drawn using probability proportional to size principles. The sample was drawn from the master sample, which Statistics South Africa uses to draw samples for its regular household surveys. The master sample is drawn from the database of enumeration areas (EAs) established during the demarcation phase of Census 1996. As part of the master sample, small EAs consisting of fewer than 100 households are combined with adjacent EAs to form primary sampling units (PSUs) of at least 100 households, to allow for repeated sampling of dwelling units within each PSU. The sampling procedure for the master sample involves explicit stratification by province and within each province, by urban and non-urban areas. Within each stratum, the sample was allocated disproportionately. A PPS sample of PSUs was drawn in each stratum, with the measure of size being the number of households in the PSU. Altogether approximately 3 000 PSUs were selected. In each selected PSU a systematic sample of ten dwelling units was drawn, thus, resulting in approximately 30 000 dwelling units. All households in the sampled dwelling units were enumerated.

The LFS is based on a rotating panel design to collect labour force statistics from households, to ultimately obtain a better picture of movements into and out of the labour market over time. A rotating panel sample involves visiting the same dwelling units on a number of occasions (in this instance, five at most). After the panel is established, a proportion of these dwelling units is replaced each round (in this instance, 20%). New dwelling units are added to the sample to replace those that are taken out. The advantage of this type of design is that it provides the basis for monitoring changes in the work situation of members of the same households over time, while retaining the larger picture of the overall employment situation in the country. It also allows for both longitudinal and cross-sectional analysis.

A subset of 1 000 PSUs was drawn from the master sample for the pilot LFS of February 2000. For the subsequent rounds, the sample was increased to 3 000 PSUs for September 2000 and February 2001, in which the same 30 000 dwelling units were visited. In September 2001 a new sample of 30 000 dwelling units was drawn. In February 2002, 80% of the dwelling units sampled in September 2001 were visited again. The remaining 20% comprised new dwelling units. The same rotation procedure has been implemented for all subsequent rounds.

A new master sample will be drawn in September 2004 benchmarked to Census 2001 for the LFS for the next five years.

²This reference period has been increased from one week to two weeks.

3. Coverage

The target population is all households and residents in workers' hostels. The survey does not cover institutions such as old age homes, hospitals, prisons and military barracks.

4. Weighting the LFS of March 2004

A two-stage weighting procedure was applied to the LFS of March 2004.

The PSU inclusion probability is given by

$$P_{PSU} = \frac{n_{PSU}}{N_{PSU}} \cdot n_s,$$

where n_{PSU} is the number of households constituting the selected PSU during census fieldwork, n_s is the number of PSUs per stratum, and N_{PSU} is the number of households constituting the selected stratum during census fieldwork.

The household inclusion probability per PSU is given by

$$P_{HH} = \frac{n_{HH}}{H_{HH}},$$

where n_{HH} is the number of selected dwelling units per PSU, H_{HH} is the number of dwelling units in the PSU in question at a particular time different from the census time.

The non-response adjustment factor is given by $\frac{1}{r_{HH}}$, where r_{HH} is the response rate and is given by

$r_{HH} = \frac{n_{RESP}}{n_T}$ where n_{RESP} is the number of responding households and n_T is the total number of visited households (in the sampled dwelling units) per PSU. The sample weights adjusted for non-response are now given by

$$W_{HH} = \frac{1}{P_{PSU} \cdot P_{HH} \cdot r_{HH}}$$

A SAS macro called CALMAR was used to benchmark W_{HH} to the population mid-year estimates. The mid-year estimates were adjusted to give population estimates for March 2004 (when survey fieldwork took place).

5. Symbols used in the tables that follow

When a dash (-) is shown there were no respondents in the category.

When a single asterisk (*) is shown in the table, the sample size was too small to give reliable estimates.

6. Comparability of results with other Stats SA data sources

The quarterly survey of employment and earnings (SEE) collects information on formal employment in South Africa, published in *Statistical release P0275*. The results of the March and September rounds of the SEE are comparable to the LFS.

7. Confidence intervals

Stats SA has calculated 95% confidence limits for key variables. These are available on request to users who require this information.

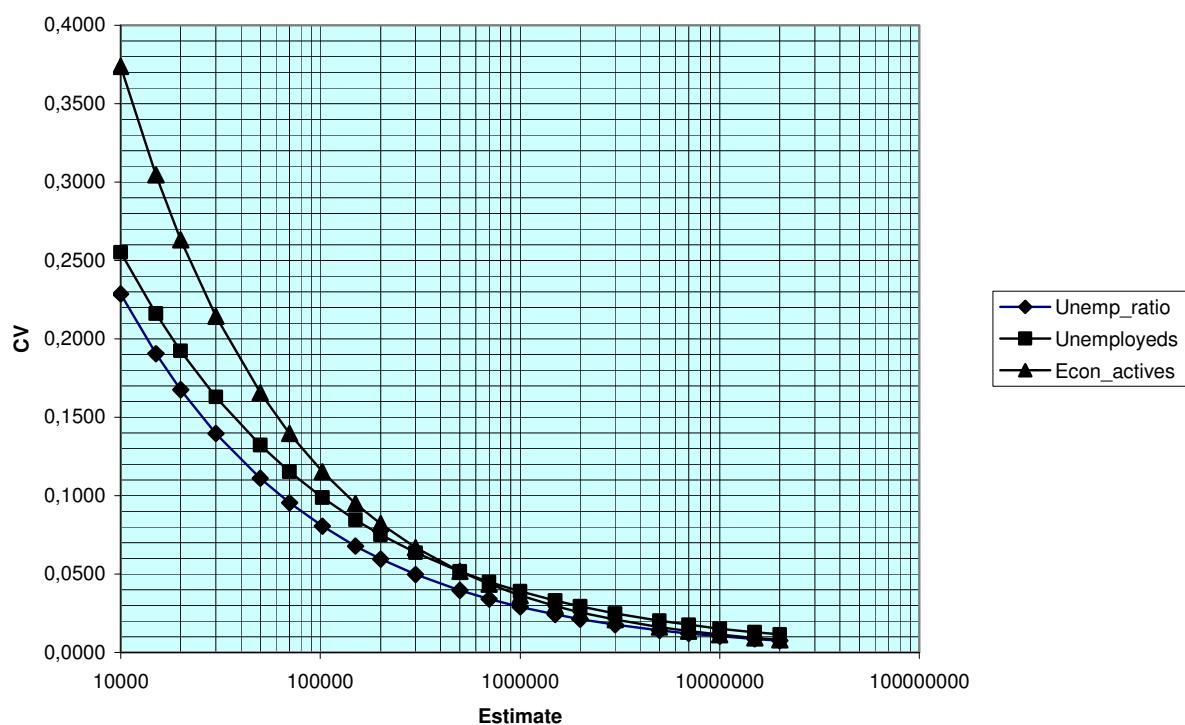

8. Estimation and use of standard error

The published results of the labour force survey are based on representative probability samples drawn from the South African population, as discussed in the section on sample design. Consequently,

all estimates are subject to sampling variability. This means that the sample estimates may differ from the population figures that would have been produced if the entire South African population had been included in the survey. The measure usually used to indicate the probable difference between a sample estimate and the corresponding population figure is the *standard error (SE)*, which measures the extent to which an estimate might have varied by chance because only a sample of the population was included.

There are two major factors which influence the value of a standard error. The first factor is the sample size. Generally speaking, the larger the sample size, the more precise the estimate and the smaller the standard error. Consequently, in a national household survey such as the LFS, one expects more precise estimates at the national level than at the provincial level due to the larger sample size involved. The second factor is the variability between households of the parameter of the population being estimated, for example, the number of unemployed persons in the household.

Coefficient of variation (CV) by estimate for the unemployed, the unemployment rate and the economically active (using the official definition of employment): March 2004

DEFINITIONS OF TERMS

A *household* is defined as a person, or group of persons, who occupy a common dwelling unit (or part of it) for at least four days in a week on average during the past four weeks prior to the survey interview. Basically, they live together and share resources as a unit. Other explanatory phrases can be “eating from the same pot” and “cook and eat together”.

A *dwelling unit* is any structure or part of a structure or group of structures occupied by one or more than one household; or which is vacant or under construction but could be lived in at the time of the survey. The dwelling unit is the major listing unit for this survey. However, if multiple households are identified during listing, then each household is listed separately. But the listing unit is not primarily households, as multiple households are sometimes discovered at the time of the survey. In workers hostels, (1) where rooms are occupied by individual persons/households, then each room is treated as a dwelling unit, and (2) in the case of dormitories/communal rooms, each bed is listed separately and treated as a dwelling unit. It is important to note that the dwelling unit as defined here was also the selection unit for this sample.

Population group describes the racial classification of a particular group of South African citizens. The previous government used legislation to impose this type of classification, to divide the South African population into distinct groupings on which to base apartheid policies. For quite a different reason it remains important for Stats SA to continue to use this classification wherever possible. It clearly indicates the effects of discrimination of the past, and permits monitoring of policies to alleviate discrimination. Note that, in the past, population group was based on a legal definition, but it is now based on self-perceptions and self-classification. A *black African* person is someone who classifies him/herself as such. The same applies to a *coloured, Indian/Asian or white* person.

Workers' hostel is a communal living quarter for workers, provided by a public organisation such as a local authority, or a private organisation such as a mining company. These were residential dormitories established for migrant workers during the apartheid era, and they continue to house people working in certain industries, such as the mining industry.

The *working age population* comprises all persons aged 15–65 years.

The *economically active population* consists of both those who are employed and those who are unemployed.

The *employed* are those who performed work for pay, profit or family gain in the seven days prior to the survey interview, or who were absent from work during these seven days, but did have some form of work to which to return.

The *official unemployment rate*: see Note 1.

The *expanded unemployment rate*: see Note 1.

The people who are *out of the labour market* or who are *not economically active* are those who are not available for work. This category includes full-time scholars and students, full-time homemakers, those who are retired, and those who are unable or unwilling to work.

The *formal sector* includes all businesses that are registered in any way.

The *informal sector* consists of those businesses that are not registered in any way. They are generally small in nature, and are seldom run from business premises. Instead, they are run from homes, street pavements or other informal arrangements.

Workers include the self-employed, employers and employees.

Labour market dynamics refer to movement into, out of, and within the labour market over a specified time period.
